

Use Case Description

Living Labs

Living Lab 1: Backhauling & Co-Loading

Living Lab 2: Synchromodality

Living Lab 3: Reduction of Waiting times

Living Lab 4: Virtual Living Lab

Q&A

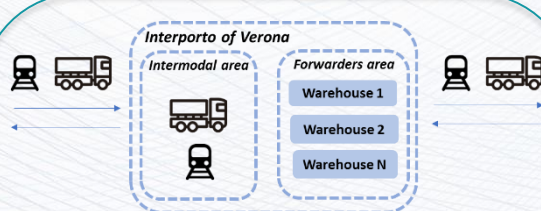

LOGISTAR services will be **tested under real operation environment** in four Living Labs

Backhauling and Co-loading

Process of various information coming from the different companies (schedules, resources, constraints, truck, positions, empty return legs...) to improve backhauling management

Overall overview of the status of the operations through the real-time dashboards and the real-time information on road transport system.

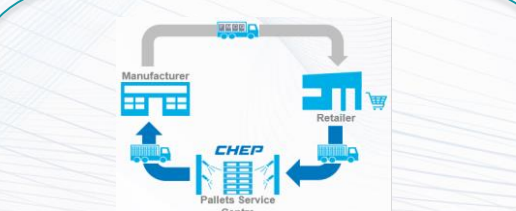

Synchromodality

Real time re-planning due to disrupting events: corrective and preventive

Planning of synchromodal routes basing on real time events.

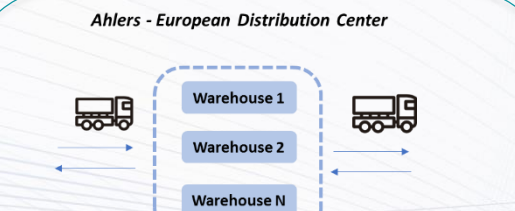

Dynamic assignation of freight transport networks.

Real time status on goods movements: position of vehicles, arrival time of cargo fleets.

Reduction of waiting times

The reduction of waiting times through live vehicle tracking and a reliable prediction of the ETA combined with a sophisticated software solution to manage and allocate slots dynamically is key for a smooth and efficient transport operation; as per our experience this would also be a key enabler for efficient Horizontal Transport Collaboration projects.

Virtual Living Lab

Real time planning of resources looking for transport synergy and bundling opportunities.

Real-time alerts and recommendations to take action, facilitating the decision-making process.

LOGISTAR services will be **tested under real operation environment** in four Living Labs

Backlog management

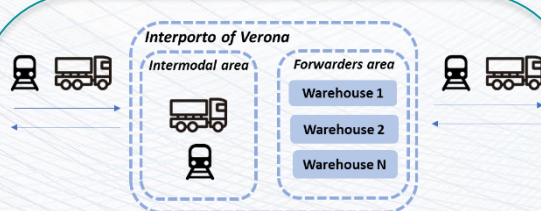

Process of various information coming from the different companies (schedules, resources, constraints, truck, positions, empty return legs...) to improve backhauling management

Overall overview of the status of the operations through the real-time dashboards and the real-time information on road transport system.

Synchronicity

Real time re-planning due to disrupting events: corrective and preventive

Plannian 2.912153 nchromodal routes basing on real time events.

Dynamic assignation 2.912153 freight transport networks.

Real time status on goods movements: position 2153 vehicles, arrival time 2153 cargo fleets.

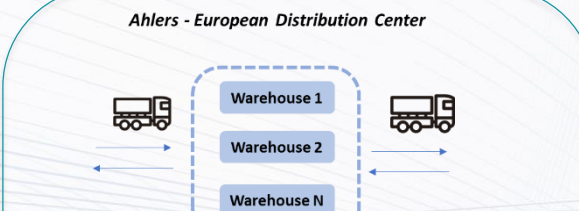

Reduction of waiting times

The reduction of waiting times through less vehicle tracking and a reliable prediction of the ETA combined with a dynamic management of the transport operations.

Virtual Living Lab

Real time planning of resources looking for transport synergy and bundling opportunities.

Real-time alerts and recommendations to take action, facilitating the decision-making process.

Living Lab 1: Backhauling and Co-loading

About 12 years ago Nestlé had an issue with empty running. It was delivering over 15 loads per day from its factories in the North of England to its distribution centre in Leicestershire. However, only 80% of these loads could be tied to a return journey, so every day 2 or 3 trucks would return to the North empty. pladis was delivering loads on a daily basis to Yorkshire from its distribution centre close to in the Midlands and some of these loads presented opportunities for round tripping vehicles. Both shippers wanted to reduce cost, reduce CO2 emissions and maximise asset utilisation. Having met at an IGD event, Nestle and pladis decided they could share the use of trucks to create round trips and reduce empty running, saving over a quarter of a million kilometres per year.

Living Lab 1: Backhauling and Co-loading

Real time backhauling in the FMCG sector

Process of various information coming from the different companies (*schedules, resources, constraints, truck, positions, empty return legs...*) to improve backhaul management.

Co-loading opportunities will also be considered, plus any cost-effective alternative modes of transport.

Overview of the status of the operations through real-time dashboards and real-time information on road transport system.

The execution of the living lab will be split into several phases starting with the collection of historical data from both Nestlé and pladis. A strategic analysis will be conducted in order to understand the current logistic networks of both companies. This data will be used to set up and test the Logistar system, prior to the go live of the use case.

CHEP EU Key Data & Logistics operating Model

Our platforms and solutions enable profitability and sustainability without having to compromise one for the other. We manage, maintain, transport and supply more than 330 million platforms, crates and containers that are shared and reused by growers, manufacturers, distributors and retailers.

Every day CHEP is delivering, collecting and relocating more than 4,5 million pallets from and to our 240 Service Centers in Europe, an equivalent of over 6.000 FTL with 7.500 transport orders.

Suggested KPI's & Dashboard for LL3

Title of dataset	Short description
Average waiting time for loading / unloading	Average time from arrival to service center location till departure of truck
Daily idle time at Fuenlabrada Service Center	Daily time where unloading bays / forlifts are not active due to no trucks
Vehicle productivity (CHEP productivity)	Av daily time trucks are productive / driving and not waiting for loading / unloading
Detection of potential customer service failures	Improvement of proactive customer info on late service due to delays at the SC
Improved On Time delivery performance	Improvement of OTD performance due to reduced waiting times at SC

Fleet Schedule – Estimated times of arrival										KPIs per truck?
	8:00	9:00	10:00	11:00	12:00	13:00	14:00	15:00		
1234ABC	(on route → ETA 9:30)	Loading Bay 1								
2345QWE		(on route → ETA 11:30)		Loading Bay 1						
3456ASD			(on route → ETA 12:00)		Loading Bay 2					
4567ZXC		(on route → ETA 11:00)		Loading Bay 3						
5678BNM		(on route → ETA 11:30)			Loading Bay 3					
6789DFG			(on route → ETA 13:30)			Loading Bay 1				
(...)										
Yard Loading / Unloading Bay Planification										KPIs per yard?

Improved vehicle efficiency through **shorter waiting time** (increasing available transport capacity in the market)

Improved **yard efficiencies** due to less idle time between loading & unloading operations

Improved customer **service** through avoidance of unexpected and at this stage **unpredictable delays at loading / unloading**

Remove one of the main blockers for Horizontal Collaboration projects with dedicated trucks through improved loading / unloading time prediction

LOGISTAR services will be **tested under real operation environment** in four Living Labs

Backhauling and Co-loading

Process of various information coming from the different companies

(schedules, resources, constraints, truck, positions, empty return legs...) to improve backhauling management

Overall overview of the status of the operations through the real-time dashboards and the real-time information on road transport system.

pladis

Synchromodality

Real time re-planning due to disrupting events: corrective and preventive

Planning of synchromodal routes basing on real time events.

Dynamic assignation of freight transport networks. Real time status on goods movements: position of vehicles, arrival time of cargo fleets.

Reduction of waiting times

The reduction of waiting times through live vehicle tracking and a reliable prediction of the ETA combined with a sophisticated software solution to manage and allocate slots dynamically is key for a smooth and efficient transport operation; as per our experience this would also be a key enabler for efficient Horizontal Transport Collaboration projects.

Ahlers - European Distribution Center

Virtual Living Lab

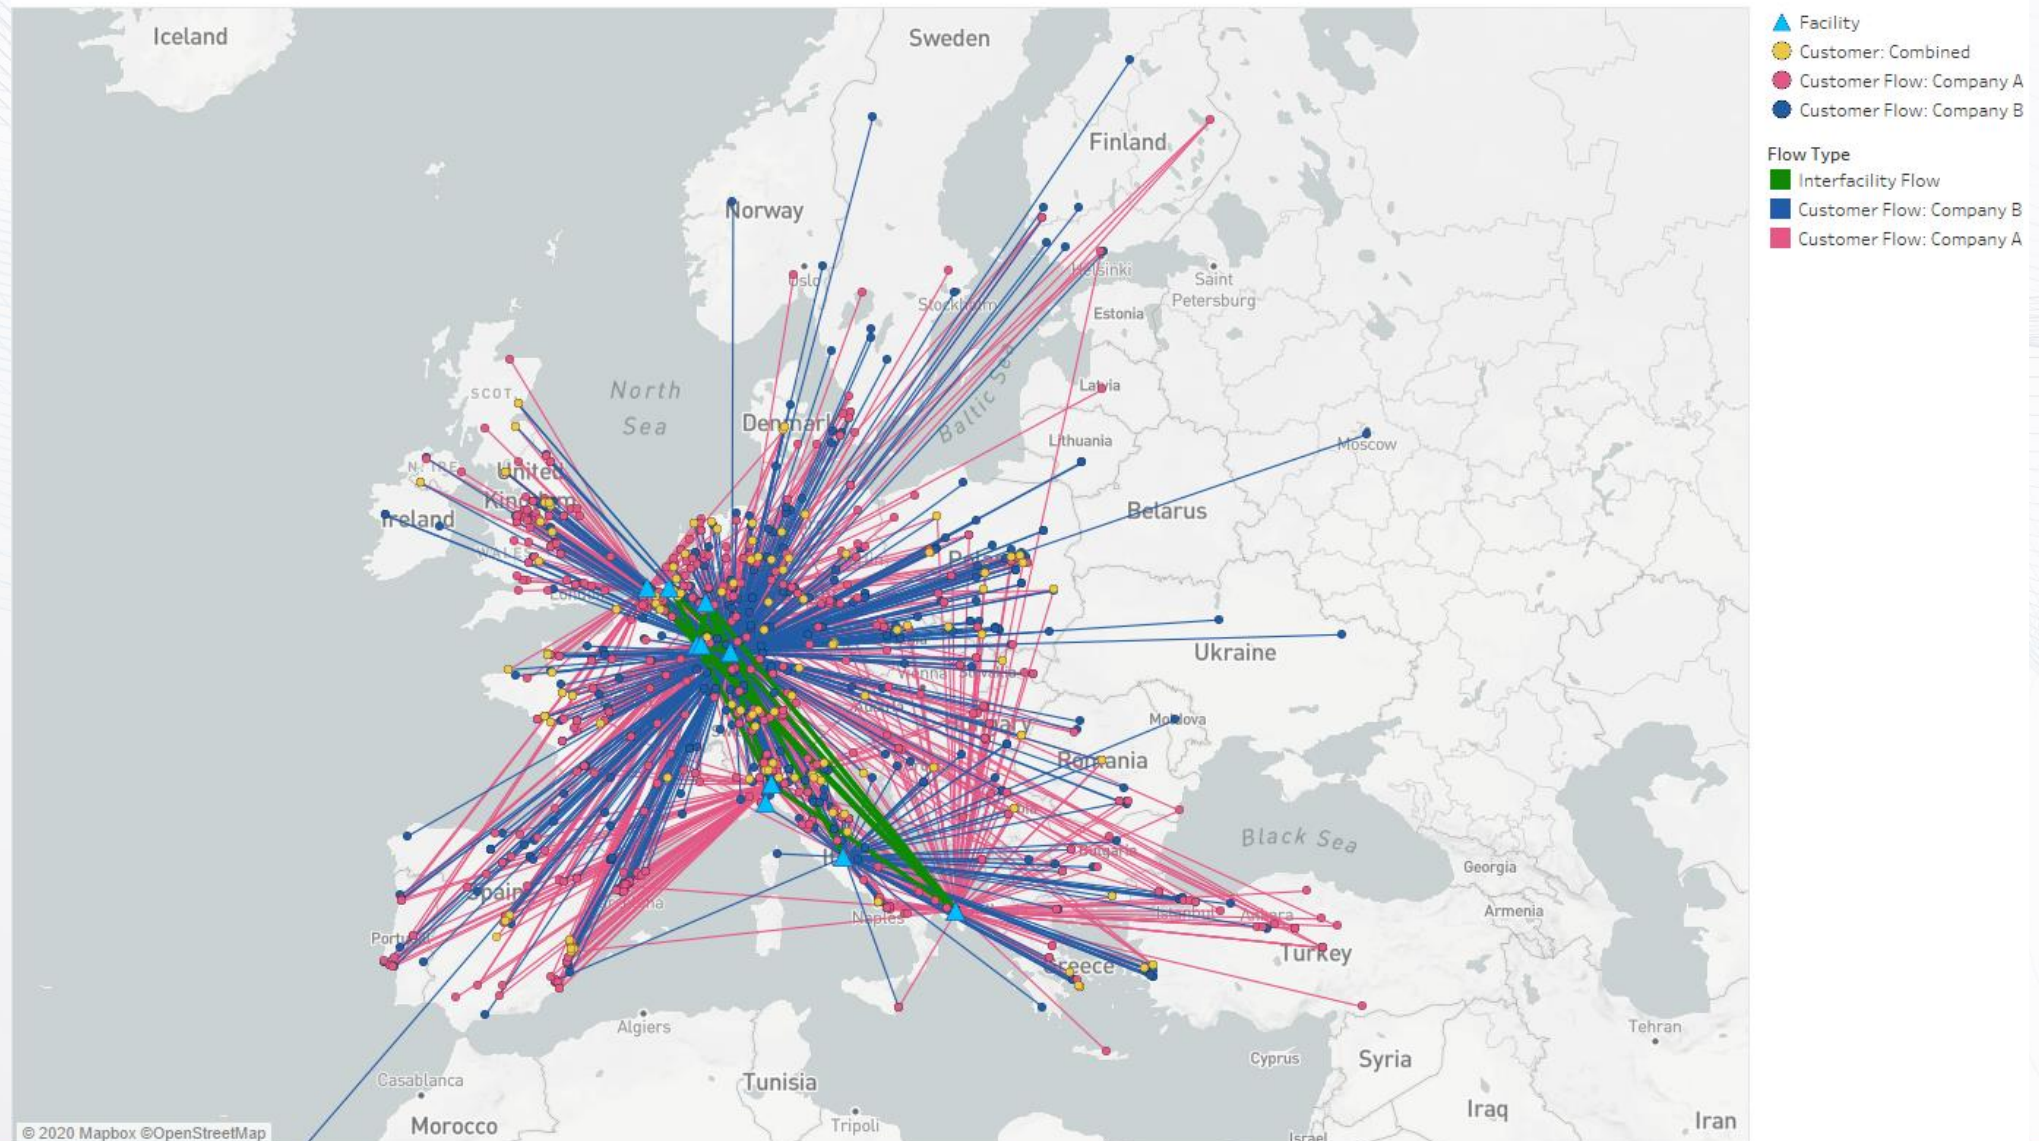

Real time planning of resources looking for transport synergy and bundling opportunities.
